Iconography

Overview

Icons are a key part of the Netwrix visual system. We use two categories of icons: Core Icons and Supporting Icons.

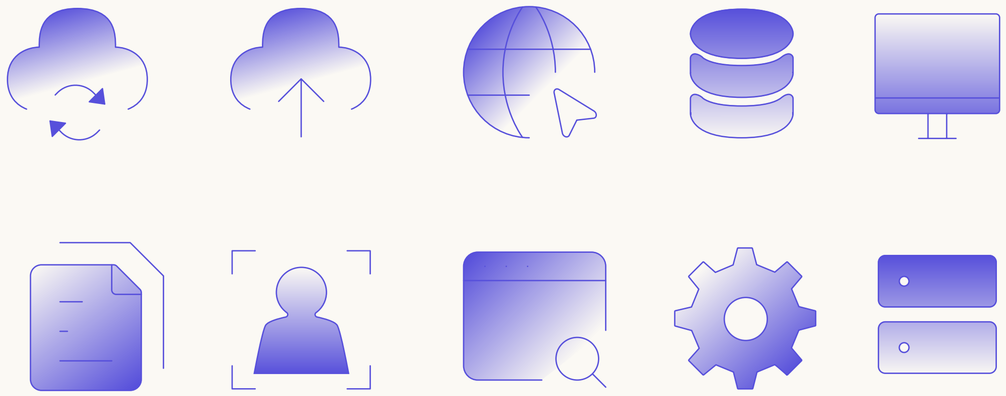
Icon Guidance

- Use Core Icons whenever possible as they are the most “on-brand.”
- Use Supporting Icons when needed, and in smaller roles.
- Do not mix Core and Supporting Icons within the same set or visual group — keep them visually consistent.
- Always ensure legibility: icons should be clear, sharp, and appropriately scaled.

Core Icons

These icons should always be the first choice when an appropriate option is available.

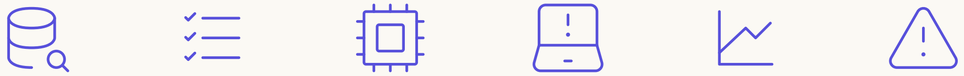
- Use in marketing materials, websites, large-format designs, or anywhere the icon needs to stand out.
- Core icons can scale to larger sizes while maintaining clarity and impact.



Supporting Icons

The Supporting Icon set expands our library for specific use cases not covered by Core Icons.

- Best used in smaller applications like alongside text, within product/UI, or in presentation decks and documents.
- Supporting icons should stay secondary, providing function without overshadowing the branded Core Icons.



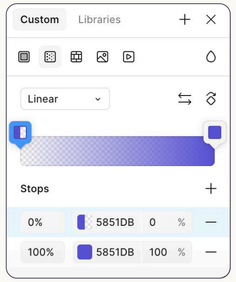
Iconography

Core Icons

Our core icons are carefully crafted to feel unique to the Netwrix identity.

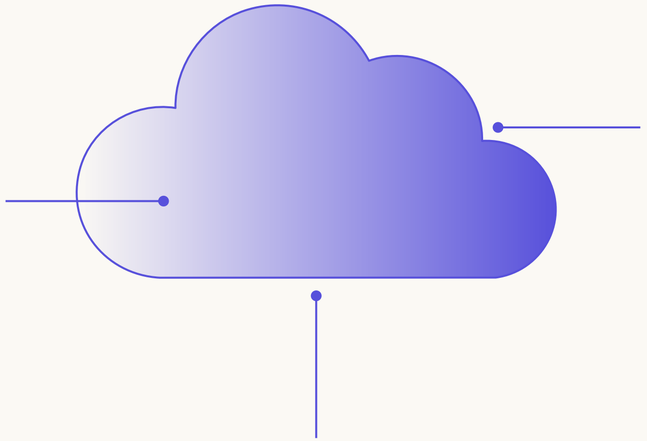
If new icons need to be created, they must follow the established style so the system stays consistent and recognizable. The design approach balances clarity, scalability, and a branded visual character.

Download Core Icons



Fill

Gradient fill of same color from 100 to 0% opacity. Angle can be adjusted to best suit icon design.



Corners

Stroke corners should be set to round.

Stroke

Weight is flexible but should remain light, between 1-3px depending on size.

Iconography

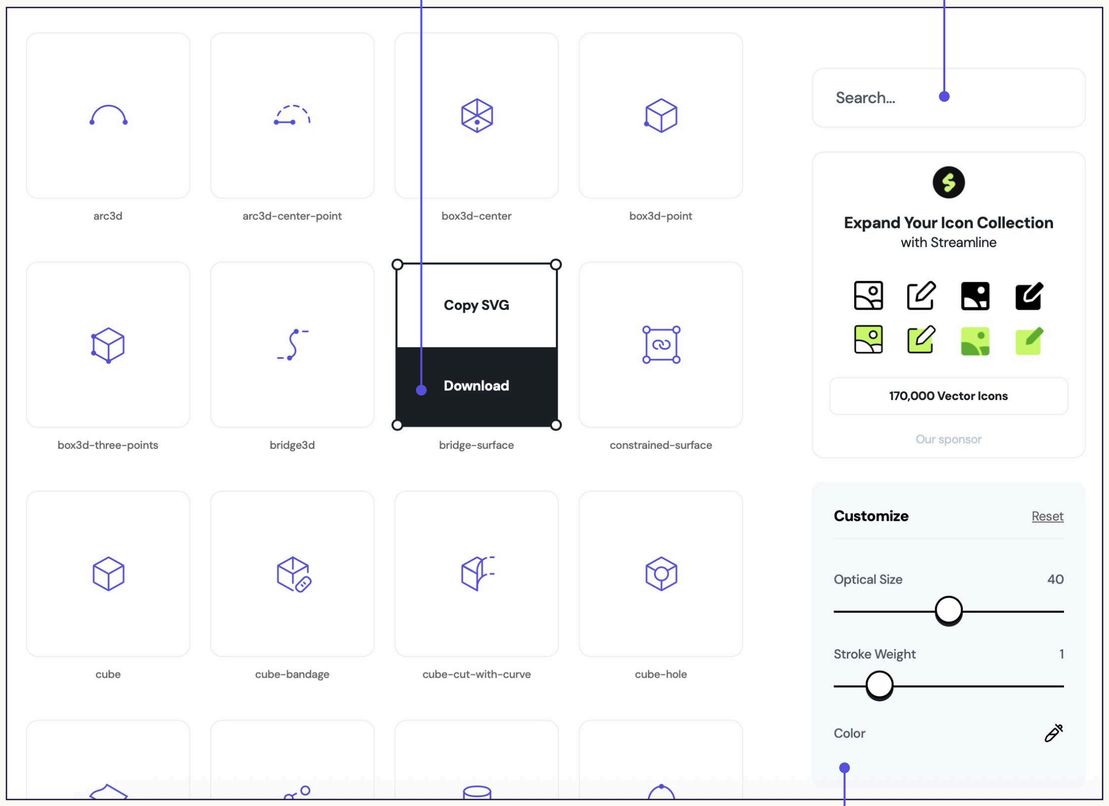
Supporting Icons

Additional supporting icons should be sourced from Iconoir or a similar stock imagery site. Ensure that they follow similar specifications shown here.

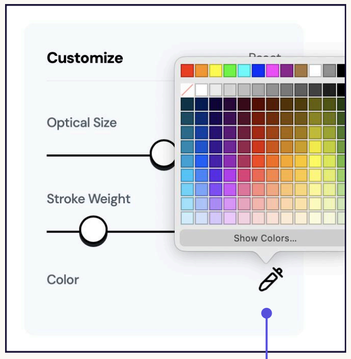
- Use icons with an outlined style rather than filled
- Ensure you are using brand-approved colors
- The SVG files downloaded can be placed directly into PowerPoint or similar application where you can change the outline color if needed

Hover over an icon you want and hit 'Download' to save the SVG file to your computer.

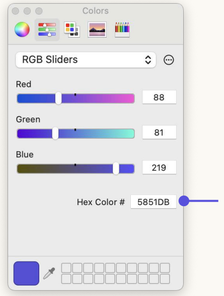
Search for your subject matter here.



Optical size and Stroke Weight should generally follow these specifications.



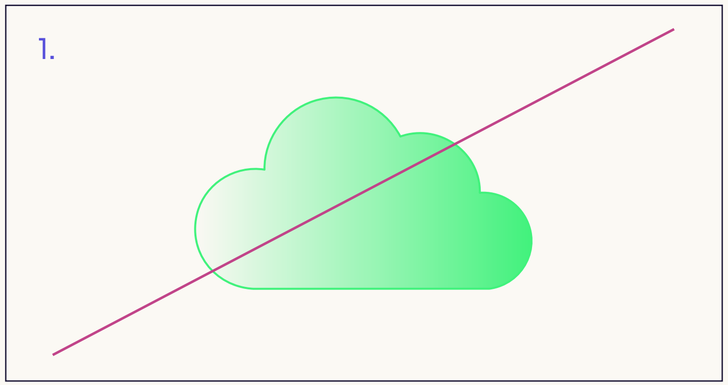
To change the icons color, hit the Eyedropper icon and select 'Show Colors'

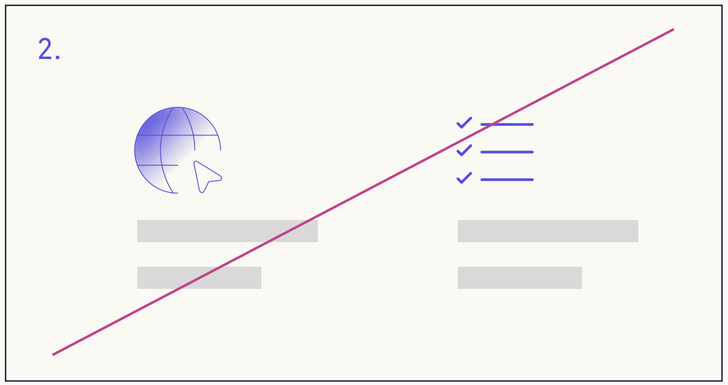


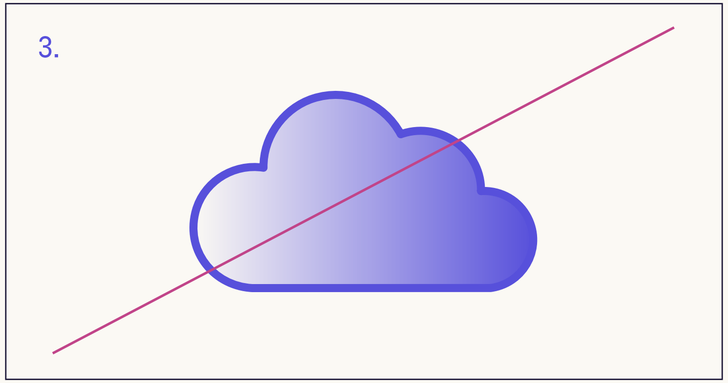
This will bring up a color panel where you can enter a brand-approved color HEX code.

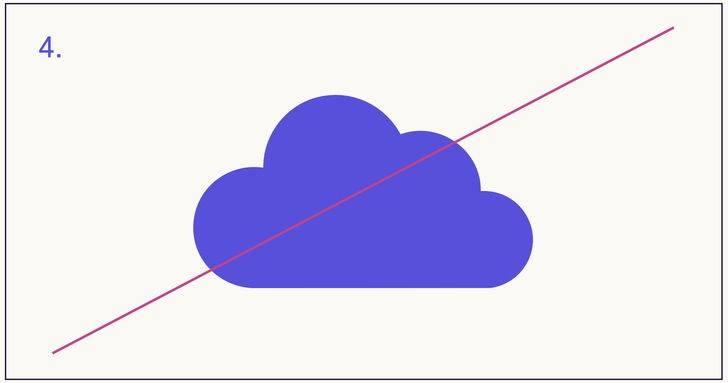
Iconography

Misuse

The examples shown here illustrate some incorrect uses of our icons.








1. Don't use Beacon Green icons on light backgrounds.
2. Don't mix Core and Supporting Icons within the same set or visual group.
3. Don't use a thick stroke weight.
4. Don't use solid-filled icons.
